

REBUILT

Rebuilding involves reconditioning by cleaning, inspecting and replacing broken or severely worn parts. Serviceable parts may be reused within the manufacturer's acceptable wear limits. Rebuilt components quality can vary widely and many rebuilt products come with only a short term warranty.

REMANUFACTURED

To remanufacture is to make as closely to new as possible. All core material – case, extension housing, pump, valve body, converter and various internal components - are carefully inspected, checked against original equipment measured specifications for correct dimensional tolerances, and precisely remanufactured to ensure proper operating pressures. Replacement parts are new or qualified to meet exacting standards and tolerances. Testing of the transmission is performed to manufacturer measured specifications as well as original production standards.
